

**PHENOLOGICAL OBSERVATIONS IN NOVA SCOTIA AND CANADA,  
1902.—BY A. H. MACKAY, LL. D.**

*(Received for publication, May, 1903.)*

I present in the two tables following a summary of (1) the detailed observations made in Nova Scotia, mainly through the agency of the public schools, and (2) the more general observations made throughout the Dominion of Canada.

The object sought for in the Nova Scotian public school system is the educational one; for the pupils of the schools are the observing naturalists, the teacher being the responsible compiler and recorder of the observations.

The smaller work of the general compilation and publication of the averages of local observations is only the secondary object; but the results are now deemed to be more accurate than those made by individuals only at each station.

References in my previous papers have been made to the observations collected and published by Dr. Ihne of Darmstadt from the continent of Europe; to the school observation system like our own, which is now being, with interesting results, tried in Denmark, under the inspiration of Mr. Carl Michelsen, of Skanderborg, and the practical guidance of M. J. Mathiassen; and to the Natural History Society work of British Columbia.

I have only just received the Report on the Phenological Observations of Great Britain and Ireland for 1902, by Edward Mawley, F. R. Met. Soc., F. R. H. S., which is published in the *Quarterly Journal of the Royal Meteorological Society*, vol. XXIX. No. 126, April, 1903. This shows an advance in the treatment of these observations over other publications seen at date; and our system of using "annual" instead of "mensual" dates is exploited in a capital series of phenochronic graphs.

## NOVA SCOTIAN PHENOCHRONS.

As these are based on about 350 schedules, it will be observed that, as a rule, a good many schedules are averaged for each of the ten meteorological or biological regions of the province. The individual schedules are annually bound up into a volume which can be utilized by weather students in the future with every facility. There are already a number of such volumes in existence. And those of the last years have, to a considerable extent, been analyzed and compiled by a staff of specialists so as to give the phenochrons of the coast, lowland and highland belts of each county. These sheets are likewise being bound up in annual volumes. The Nova Scotian table published here is merely the most generalized average of averages.

A close study of the tables showing individual observations, will create the impression that observers are not always in a position to note the phenomena of the seasons when they first appear. In this respect the observations conducted by the public schools are more accurate. For they are made by a large number of individuals travelling nearly every day to school and radiating from this central point of the community for a distance generally of about two miles. As the teachers stimulate "observing" by noting the first one who brings evidence of the first appearance of a flower, etc., there is a great deal of competitive observation on the part of the young people. This not only makes the travelling to and from school more interesting; but is found to be a great aid to general "nature study." Accuracy is assured by the bringing of the specimen to the school room when practicable.

But even in schools mistakes may occur through accident in recording, and sometimes from lack of sufficient knowledge of the natural history of the locality. In order to discover such mistakes, and to enable directions to be framed in order to minimize them, as well as for the purpose of studying and compiling regional phenochrons, the observation schedules filled in by the teacher of each school is sent to one of a staff of special-

ists. Their criticisms are annually published in the *Journal of Education of Nova Scotia*, which also contains the names of observers and number of observations made in each of the schools reporting. Under the advice of this phenological staff several changes were made in the schedules issued after 1902, which are known as the "1903 schedule."

The names and addresses of the Nova Scotian phenological staff at present are as follows :

- C. B. Robinson, B. A., Science Master, Pictou Academy.  
E. J. Lay, Principal, Amherst Academy.  
J. E. Barbeaux, Science Master, Truro Academy.  
Antoinette Forbes, B. A., Windsor Academy.  
Burgess McKittrick, B. A., Principal, Lunenburg Academy.  
Minnie C. Hewitt, Lunenburg Academy.  
G. R. Marshall, Principal, Richmond School, Halifax.  
Stanley C. Bruce, Principal, Shelburne Academy.  
A. W. Horner, Principal, Public School, Yarmouth.

#### CANADIAN PHENOCHRONS.

The second table contains the observations of the following members of the Botanical Club of Canada on the dates of the first appearances of the phenomena briefly indicated only in the table, although precisely specified in the schedules for recording them ; and are published here in order to keep the series published in the Transactions of our Institute continuous. The addresses and stations of the observers are as follows, in the order of the table :

T. A. Good, Woodstock, New Brunswick ; J. M. Duncan, Charlottetown, Prince Edward Island ; John McSwain, Charlottetown, Prince Edward Island ; Dr. Cephas Guillet, Ottawa, Ontario ; Mrs. Frank E. Webster, Beatrice, Muskoka, Ontario ; Dr. J. H. Elliott, Gravenhurst, Muskoka, Ontario ; T. R. Donnelly, Pheasant Forks, Assiniboia ; Percy B. Gregson, Blackfalds, Alberta ; J. K. Henry, B. A., Vancouver, British Columbia.

The first column is the average of about 350 schedules of observations made by as many of the public schools of the province of Nova Scotia, and the active members of the club among whom the following have been sending in reports: Rev. James Rosborough, Musquodoboit Harbor, Halifax Co.; Miss Louise MacMillan, Sydney Mines, Cape Breton; Mrs. G. Ormond Forsyth, Port Hawkesbury, Inverness Co.; and Miss Janet Keith Bruce Kelley, Yarmouth.

The last column is the average of scattered observations from about ten observers in different parts of the south of British Columbia, five being from Vancouver Island or the coast, two from the dry belt, and three from the mountain belt. These observations were made on the schedule prepared and published by the Natural History Society of the province, and were communicated to me by A. J. Pineo, Esq., B. A., of Victoria, and are published in detail in my report from the Botanical Club of Canada to the Royal Society of Canada.

## PHENOLOGICAL OBSERVATIONS IN

## NOVA SCOTIAN PHENOCHRONS, 1902.

FLOWERING AND OTHER PHENOCRONS FOR EACH REGION OF THE PROVINCE OF NOVA SCOTIA, COMPILED FROM 350 PUBLIC SCHOOL OBSERVATION SCHEDULES.

[The phenochrons for each region (which are averages of many observations) have the fractions omitted.]
